Introduction to Statistical Learning Topic 3. Statistical learning - a high-level overview and illustrative examples 3.1. What is statistical learning? Part One

Sonja Petrović Created for ITMD/ITMS/STAT 514

Spring 2021.

Goals of this lecture

- Setting the context: data mining
- A few illustrations on applications of statistical learning
- Stat.Learn.:
 - what is it?
 - how is it done?
- Resources and links

Section 1

Setting the context: data mining

What is data mining?

Data mining is the science of discovering structure and making predictions in large or complex data sets.

Spam filtering, Fraud detection, Event detection

Spam filtering, Fraud detection, Outbreak detection

- How can we tell apart spam from real emails?
- How do we identify fraudulent transactions?
- Is the president's tweet going viral?

Spam filtering, Fraud detection, Outbreak detection

- How can we tell apart spam from real emails?
- How do we identify **fraudulent** transactions?
- Is the president's tweet going viral? Is the flu going viral?

Recommendation systems

- Which movies should I recommend to my customers?
- How can I identify individuals with **similar viewing/purchasing** preferences?
- Which products should I recommend to my customers?
- Which promotional offers should I send out, and to whom?

Precision medicine, health analytics

\ldots And many more applications (content tagging in images; text mining; $\ldots)$

- Predictive Analytics (Supervised learning):
 - Q: To whom should I extend credit?

- Predictive Analytics (Supervised learning):
 - Q: To whom should I extend credit?
 - Task: Predict how likely an applicant is to repay loan.
 - Q: What characterizes customers who are likely to churn?

- Predictive Analytics (Supervised learning):
 - Q: To whom should I extend credit?
 - Task: Predict how likely an applicant is to repay loan.
 - Q: What characterizes customers who are likely to churn?
 - Task: Identify variables that are predictive of churn.
 - Q: How profitable will this subscription customer be?

- Predictive Analytics (Supervised learning):
 - Q: To whom should I extend credit?
 - Task: Predict how likely an applicant is to repay loan.
 - Q: What characterizes customers who are likely to churn?
 - Task: Identify variables that are predictive of churn.
 - Q: How profitable will this subscription customer be?
 - Task: Predict how long customer will remain subscribed.

- Predictive Analytics (Supervised learning):
 - Q: To whom should I extend credit?
 - Task: Predict how likely an applicant is to repay loan.
 - Q: What characterizes customers who are likely to churn?
 - Task: Identify variables that are predictive of churn.
 - Q: How profitable will this subscription customer be?
 - Task: Predict how long customer will remain subscribed.
- Descriptive Analytics (Unsupervised learning):
 - Clustering customers into groups with similar spending habits
 - Learning association rules: E.g., 50% of clients who {recently got promoted, had a baby} want to {get a mortgage}

Section 2

A few illustrations on applications of statistical learning

Wage data

Figure 1: ISLR figure: Wage data, which contains income survey information for males from the central Atlantic region of the United States. Left: wage as a function of age. On average, wage increases with age until about 60 years of age, at which point it begins to decline. Center: wage as a function of year. There is a slow but steady increase of approximately \$10,000 in the average wage between 2003 and 2009. Right: Boxplots displaying wage as a function of education, with 1 indicating the lowest level (no high school diploma) and 5 the highest level (an advanced graduate degree). On average, wage increases with the level of education.

Stock Market data

Figure 2: ISLR figure: Left: Boxplots of the previous day's percentage change in the S&P index for the days for which the market increased or decreased, obtained from the Smarket data. Center and Right: Same as left panel, but the percentage changes for 2 and 3 days previous are shown.

Stock Market data

Today's Direction

Figure 3: ISLR figure: We fit a quadratic discriminant analysis model to the subset of the Smarket data corresponding to the 2001-2004 time period, and predicted the probability of a stock market decrease using the 2005 data. On average, the predicted probability of decrease is higher for the days in which the market does decrease. Based on these results, we are able to correctly predict the direction of movement in the market 60% of the time.

Gene Expression Data

Figure 4: ISLR figure: Left: Representation of the NCI60 gene expression data set in a two-dimensional space, Z1 and Z2. Each point corresponds to one of the 64 cell lines. There appear to be four groups of cell lines, which we have represented using different colors. **Right**: Same as left panel except that we have represented each of the 14 different types of cancer using a different colored symbol. Cell lines corresponding to the same cancer type tend to be nearby in the two-dimensional space.

Section 3

What is statistical learning?

Uncovering relationships

Figure 5: ISLRfig2.1: The Advertising data set. The plot displays sales, in thousands of units, as a function of TV, radio, and newspaper budgets, in thousands of dollars, for 200 different markets. In each plot we show the simple least squares fit of sales to that variable... In other words, each blue line represents a simple model that can be used to predict sales using TV, radio, and newspaper, respectively.

Estimating f

- More generally, suppose that we observe a quantitative response Y and p different predictors, X₁, X₂,..., X_p.
- We assume that there is some relationship between Y and $X = (X_1, X_2, ..., X_p)$, which can be written in the very general form

$$Y = f(X) + \epsilon.$$

- f is some fixed but unknown function of X_1, X_2, \ldots, X_p .
- ϵ is a random error term, which is independent of X and has mean zero.
- In this formulation, *f* represents the *systematic* information that *X* provides about *Y*.

Another example

Figure 6: ISLRfig2.2: The Income data set. Left: The red dots are the observed values of income (in tens of thousands of dollars) and years of education for 30 indi- viduals. Right: The blue curve represents the true underlying relationship between income and years of education, which is generally unknown (but is known in this case because the data were simulated). The black lines represent the error associated with each observation. Note that some errors are positive (if an ob- servation lies above the blue curve) and some are negative (if an observation lies below the curve). Overall, these errors have approximately mean zero.

Summary: essence of statistical learning

Takeaway

Statistical learning refers to a set of approaches for estimating f.

- Let's outline some of the key theoretical concepts that arise in estimating *f*,
- as well as tools for evaluating the estimates obtained.

Two reasons: prediction and inference.

Two reasons: prediction and inference.

Prediction

- A set of inputs X are readily available,
- but the output Y cannot be easily obtained.
- Since the error term averages to zero, we can predict Y using

$$\hat{Y} = \hat{f}(X),$$

where \hat{f} represents our estimate for f, and \hat{Y} represents the resulting prediction for Y.

• $\hat{f} = a$ black box.

Prediction

- A set of inputs X are readily available,
- but the output Y cannot be easily obtained.
- Since the error term averages to zero, we can predict Y using

$$\hat{Y} = \hat{f}(X),$$

where \hat{f} represents our estimate for f, and \hat{Y} represents the resulting prediction for Y.

• $\hat{f} = a$ black box.

Example

- X₁, X₂,..., X_p are characteristics of a patient's blood sample that can be easily measured in a lab,
- Y is a variable encoding the patient's risk for a severe adverse reaction to a particular drug.

It is natural to seek to predict Y using X: we can then avoid giving the drug in question to patients who are at high rick of an adverse.

Two reasons: prediction and inference.

Two reasons: prediction and inference.

Inference

- We are often interested in *understanding the way* that Y is affected as X_1, X_2, \ldots, X_p change.
- Estimate *f*; not necessarily to make predicitons for *Y*, but **understand the relationship** between *X* and *Y*:
 - how Y changes as a function of X_1, X_2, \ldots, X_p .
 - *f* can't be a black box.
 - Questions:
 - Which predictors are associated with the response?
 - What is the relationship between the response and each predictor?
 - an the relationship between Y and each predictor be adequately summarized using a linear equation, or is the relationship more complicated?

Inference

- We are often interested in *understanding the way* that Y is affected as X_1, X_2, \ldots, X_p change.
- Estimate *f*; not necessarily to make predicitons for *Y*, but **understand the relationship** between *X* and *Y*:
 - how Y changes as a function of X_1, X_2, \ldots, X_p .
 - *f* can't be a black box.
 - Questions:
 - Which predictors are associated with the response?
 - What is the relationship between the response and each predictor?
 - an the relationship between Y and each predictor be adequately summarized using a linear equation, or is the relationship more complicated?

Example - Advertising data set

- Which media contribute to sales?
- Which media generate the biggest boost in sales? or
- How much increase in sales is associated with a given increase in $T_{2}V_{/30}$

How Do We Estimate f?

Figure 7: Recall this example

- Observed n = 30 data points.
- These observations are called the training data because we will use these observations to *train*, or *teach*, our method how to estimate *f*.
- we apply a statistical learning method to the training data in order to estimate the unknown function *f*.

"We apply a statistical learning method to the training data in order to estimate the unknown function f:"

Find a function \hat{f} such that $Y \approx \hat{f}(X)$ for any observation (X, Y).

"We apply a statistical learning method to the training data in order to estimate the unknown function f:"

```
Find a function \hat{f} such that Y \approx \hat{f}(X) for any observation (X, Y).
```

- Parametric methods
 - Select model (make an assumption about the functional form, or shape, of *f*; e.g., linear, say)
 - Train/fit the model (e.g. ordinary least squares, say).
- Non-parametric methods:
- do not make explicit assumptions about the functional form of f.
- Seek an estimate of *f* that gets as close to the data points as possible without being too rough or wiggly.

Parametric vs. nonparametric:

- Non-parametric advantage:
 - by avoiding the assumption of a particular functional form for f, they have the potential to accurately fit a wider range of possible shapes for f.
 - Any parametric approach brings with it the possibility that the functional form used to estimate f is very different from the true f, in which case the resulting model will not fit the data well.
 - In contrast, non-parametric approaches completely avoid this danger, since essentially no assumption about the form of f is made.
- Non-parametric disadvantage:
 - since they do not reduce the problem of estimating f to a small number of parameters, a very large number of observations (far more than is typically needed for a parametric approach) is required in order to obtain an accurate estimate for f.

Example

Figure 8: ISLRfig2.3. The plot displays income as a function of years of education and seniority in the Income data set. The blue surface represents the true underlying relationship between income and years of education and seniority, which is known since the data are simulated. The red dots indicate the observed values of these quantities for 30 individuals.

Figure 9: A linear model fit by least squares to the Income data from Figure prev page. The observations are shown in red, and the yellow plane indicates the least squares fit to the data.

Figure 10: ISLRfig2.5. A smooth thin-plate spline fit to the Income data is shown in yellow; the observations are displayed in red.

Figure 11: ISLRfig2.6. A rough thin-plate spline fit to the Income data. This fit makes zero errors on the training data.

Conclusion and where to next

What does it mean to be a *good predictor*? stay tuned; here's a quick example.
